

The Challenge:

The Virgin Islands Water & Power Authority in St. Croix needed to track the inventory being taken from a utility substation outside of normal business hours without requiring crews to manually record inventory that was removed.

The Solution:

The Quatred QUICKrfid® Portal creates a “choke point” where anything that passes through is identified and the data is then utilized to create whatever transaction is required to record the movement of personnel, equipment, assets, inventory, etc.

I needed a reliable and accurate method of tracking inventory that was taken from a secured substation yard when no inventory control resources were onsite. I engaged Quatred to implement an RFID portal that automatically reads any inventory loaded on a utility truck passing through the yard gate and issues the inventory in our back end inventory system!
